

BERG BOWL FANTASY FOOTBALL ANALYTICS

Product Case Study | Independent Product & Data Analysis

THE PROBLEM

Fantasy managers have large amounts of player and league information, but raw auction results are difficult to translate into a clear strategy. I wanted to determine whether historical league data could be organized into repeatable insights that improve draft and roster decisions.

THE APPROACH

Built a multi-season Berg Bowl analysis using 2023–2025 draft results. The framework organizes player auction prices, positions, manager selections, standings and performance information into views for player valuation, positional spending, manager behavior and championship-oriented analysis.

3 SEASONS	AUCTION FORMAT	ANALYSIS DECISION SUPPORT
---------------------	--------------------------	-------------------------------------

KEY OBSERVATIONS

- Auction prices create meaningful decision points: the dataset makes it possible to compare premium player costs, roster construction and the opportunity cost of spending.
- Positional spending can be analyzed systematically across seasons, creating a foundation for studying roster-construction trade-offs instead of evaluating players in isolation.
- The strongest product opportunity is personalization: combine player price, position, league context and manager behavior to produce recommendations at the moment a fantasy decision is made.

PRODUCT CONCEPT

Turn the analysis into a League-Specific Fantasy Draft Intelligence product. Ingest a league's historical auction data, identify manager tendencies and positional spending patterns, compare current prices with historical behavior, and surface value opportunities, budget trade-offs and strategy alerts.

WHAT I BUILT

- Historical auction database
- Player / position analysis
- Manager-oriented analysis
- Championship & PF framework
- Spending analysis
- Dashboard concepts

WHAT I WOULD BUILD NEXT

- Personalized draft recommendations
- Player value vs. auction price
- Manager tendency detection
- Real-time draft alerts
- Scenario modeling
- Consumer-facing UX

PM TAKEAWAY

This project demonstrates my approach to product problem-solving: start with a real user decision, structure raw data, identify patterns, translate those patterns into user value, and define a product opportunity. It combines my analytical background with a genuine understanding of fantasy-sports users.
